The presence of estrogenic substances in some medical muds of Roumania. Marthe Trancz Rainer and Octave Vladimiu. *Bull. acad. med. Roumanie* 3, 817-22 (1938) (in French). Six Roumanian muds from Tekirghiol, Budaki, Lacul Sarat, Sovata, Basna and Vatra-Dornei were ext. with ether and benzene, and the yellow-brown, oily ext. dissolved in olive oil. One 5 cc. of this ext. divided into 3-6 doses was injected once or twice for 3 days in castrated rats and the vaginal secretions were examd. 11-21 days after the injection. The mud from Tekirghiol showed an estrogenous power of 20 rat-units or 200 mouse-units, those of Vatra-Dornei, Budaki, Basna, Sovata 60, 30, 20 and 15 mouse-units, resp. The action of the ext. from the mud of Tekirghiol was studied, furthermore, by the microscopic examn. of the uterine horns of castrated rabbits. George Nachod

The hormonal reaction of the uterine body in the white mouse. Marthe Traouadal-Ramez and Octave Vladutiu. *Bull. Acad. med. Roumaine* 3, 40-51 (1937) (in French). In the epithelium of the transverse canal connecting the cavities of the 2 uterine horns in infantile white mice, there is, on treatment with small doses of folliculin (injections or peritoneal sion), animal saliva or urine, urine of pregnant woman), an increase of the number of layers of cylindrical cells forming the epithelium from 2 to 3 and an augmentation of the number of cells in these layers. With larger doses the number of layers amounts to from 4 to 8 and the number of cells in them is doubled or trebled with more or less intense keratinization and desquamation. The presence of certain hormones in the saliva and urine of *Equus caballus*. *Ibid.* 51-4. The elimination of prolactin, progesterin, folliculin and intermedin in the saliva and the elimination of prolactin and progesterin in the urine of stallions before and after castration, and of pregnant and nonpregnant mares is studied by tests on immature female and castrated female mice and rats (33 animals, injections of saliva and urine) and on fins of *Phoxinus ferreri* (samples of about 7 cm. length). The histologic study of the test animals establishes the existence of mature follicles in the ovary without any estral modification of the mucous membrane of the genital tract and the presence of all phases of the estrus in one single vaginal mucous membrane.

Abstract [Authors' English summary modified]: It is concluded
that these diseases are septico-pyemias produced by a strepto-
coccus of the viridans type. When injected intravenously in
lambs or adult sheep, this streptococcus produces the disease
within 48 hours. It was not possible to produce the disease
by administering the culture orally or by means of aerosol in-
halation. Most efficient treatment was Reverin followed by
polycillin and streptomycin. Disinfection and isolation of the
sick animals as well as early treatment are advised. Contains

TITLE:

Improved Construction of Molds for Pressing Plungers and
Bushings (Uluchshennaya konstruktsiya form dlya trambovaniya
plunzherov i bushingov)

PERIODICAL:

Steklo i keramika, 1959, Nr 6, pp 43 - 45 (USSR)

ABSTRACT:

In a number of glass-works the feeder plungers of automatic glass-molding machines are hand-made by the method of plastic molding although pressed plungers feature certain advantages. The authors of this article developed a new construction of molds for pressing plungers and bushings, i.e. the two-wing construction was replaced by a three-wing construction from which the product can be easier removed. Figure 1 illustrates the steel mold for pressing plungers, and figure 2 shows bushings, followed up by corresponding descriptions. The experiments were made with fire-clay-, kaolin-, and mullite layers, the compositions of which are given. Due to the introduction of the pressing method the output was increased by 1.5 times and the number of defective specimens was reduced. There are 2 figures.

THE LOOSELY HELD ORGANIC SUBSTANCES AS A FACTOR OF THE FORMATION OF THE SOIL STRUCTURE. S. A. Vladchenko. *Sbornik Fiz.-Khim. Issledovaniya Pochv* 17:7387901 1938, 83, 104; *Khim. Referat. Zhur.* 1939, No. 7, 50. To 10 g. samples of mineral soils (krasnozem and podzol) in the presence and in the absence of CaCl_2 was added twice of a soln. of Na humate obtained from chernozem (the 1st fraction of humous substances). In the sample the connection between the humous substances and the mineral part of the soil was detd. from the amt. of the 1st and 2nd fractions of the org. substances of the soil. The aggregation was also detd. (by sieve analysis). It was detd. that in the presence of CaCl_2 the stability of the aggregates, obtained under the influence of the humous substances, increased considerably (from 7 to 33%). The org. substances alone increased the stability of the aggregates with comparatively large units of the added humate (at 3.47% of the humate the aggregation reached 99.1%). A part of the org. substances (up to 0.4%) passed over into the 1st fraction under the conditions of the exp't. with krasnozem and another part (up to 0.1% of humus) into the 2nd fraction. The remaining amt. was left behind in the 1st fraction. V. considers that there exists a relationship between the aggregation of the soil samples and the last fraction of the org. substances. W. R. Henn

CA.

Colloid-chemical properties of soil humus. Viscosity of humic acids. S. A. Vladchenko. Colloid J., 1958, No. 6, 681-691(1959). The difference in colloid-chemical properties of humic acids obtained from soils of various genetic types was investigated by measurement of viscosity. Humic acid sepd. from mountain peat soil had a comparatively high tendency to structure formation and binding of water, whereas that sepd. from black soil (chernozem) had very slight tendency to hydration and almost none to structure formation. A. A. Podkorny

COLLOIDAL AND POLYMERIC STATE
of activated sludge. S. A. Vladychenskii. *Kolloid. Zhez.*, 9, No. 1, 23-8(1917).—Particles of activated sludge are negatively charged, their isoelectric point lying at pH 3.1-3.9. The viscosity of a sludge suspension reaches a min. of 1.74 at pH 4-5. Upon acidification the viscosity rises somewhat and upon further acidification drops again. Activated sludge is hydrophilic but not to a large degree. In high concns. activated sludge binds a considerable quantity of H₂O; at 1.25% by wt. the H₂O bound by sludge was 82.5%. As the concn. dropped to 0.625% the bound H₂O dropped to 17.15%. The H₂O is immobilized by chem. solvation only to a small extent and most of it is locked by stereometric solvation, i.e., in the structure which the sludge assumes at higher concns. This structure is quite stable; it was not destroyed under 13 cm. H₂O pressure. Dye absorption by activated sludge was tested with an acid, a substantive, and a basic (methylene blue) dye. Methylene blue was the most absorbed and the substantive dye the least. The max. effective area of activated sludge calcd. from the absorption data was 100 sq.m. per g.

Cationexchange properties of soil organic matter.
 S. A. Vladimirov. *Dokl. Akad. Nauk SSSR*, No. 112, No. 1, 29-33 (1947).
 Org. matter fractions were isolated by the Tyullin method from a solubilized chernozem. Fraction 1 was an org. mat. loosely held by the mineral component. Fraction 2 was more firmly held, and 3 was the most rapidly held. Fractions 1 and 2 were sol. in H_2O , and 3 in 0.01 N NaOH. The electromotive potential, as determined by electronboreas, of 2 was 64 and of 3 was 27. Soils of these fractions were coagulated with $CaCl_2$ with or without drying and with soils of $Fe(OH)_3$ with and without drying. The soils were washed with H_2O to remove the free electrolytes, treated with 1.1 N NaCl until all the Ca had been released, again washed with H_2O to remove electrolytes, and treated with 0.01 N, 0.01 N, and 0.1 N NaOH; in each sol. of org. matter was noted, the treatment was continued until a clear soln. was obtained. It is shown that gels obtained by the coagulation of org. matter with Ca^{2+} ions were capable of a secondary population. On exchanging the Ca with Na^+ , all the gels went into solution. On drying at 105° for 15 days, only 43% went into solution. The gels, obtained by the mutual coagulation of iron hydroxide gels with humus were found to be least soluble. One portion of org. matter is colloidal dispersed and water-sol. The second portion becomes sol. after treatment with NaCl, and it represents the fraction of free org. matter that can be coagulated by bivalent cations. The third fraction represents agglom. humates of Ca and $Fe(OH)_3$ and can be sol. only by treating the soil with alkali. The fourth portion is the one that becomes sol. in alkali only after HCl treatment. This represents a group of org. humates associated with Fe and Al.

The character of salinization of the soils in the Volga-Akhtuba bottom lands and delta. S. A. Vladychenskiy (Moscow State Univ.). *Pochvovedenie* 1953, No. 6, 31-9.— It is shown that with the approach towards the delta the ground waters contain a higher salt content (chloride, sulfate, bicarbonate, Ca, Mg, Na, K). The silty types of soils are not as highly salinized as the meadow types. In the early stages of development the meadow soils do contain less salts. The concen. and type of salts in the Volga, as the waters infiltrate into the soil, undergo variations: the concen. increases; Ca content relatively decreases; alkali metals increase; a relative decrease of the bicarbonate ions, with an increase of these as the infiltrated waters become a part of the soil soln.; a relative increase of sulfate. Title : Characteristics of the structure of soils of the Volga-Akhtuba
River Valley and Volga Delta.

Periodical : Vest. Mosk. un., Ser. fizikomat. i yest. nauk, 9, № 1, 83-92, Feb 1954

Abstract : Gives the porosity, amount of bound water, soil type, moisture content,
air space, etc. of various horizons at the Bugrist Delta, South Valley,
North Valley, Central Delta, etc. Concludes that the soils of the Volga-
Akhtuba Valley is in a comparatively early stage of soil development.
Recommends improvement of the soil structure.

Title : Utilization of river-valley lands in the German Democratic Republic

Periodical : Vest, Mosk. un., Ser. fizikomat. i yest. nauk, 10, No 2, 115-120, Mar 1955

Abstract : In the German Democratic Republic there is a considerable amount of rivervalley land in agricultural use, especially lower Elba River and Oder River valley. The author describes the soil types in these two areas. Three references: S. Berger, Landeskultur und Provinzialverband, Merseburg, 1931; G. Koennecke, Versuchsbericht 1950-1952, Halle, 1953; H. Title : Salt Cycle on the Rice Plots of the Volga Delta.

Orig Pub: Pochvovedeniye, 1957, No 4, 46-52.

Abstract: On the inundated rice fields in the southern part of the Volga-Akhtibinsk River valley and in the Volga delta, about 70% of the irrigation water is broken up in filtration. Along the border of the inundated fields, intensive filtration of the water occurs in a horizontal direction. The rate of filtration reaches maximum close to the flood checks and increases with depth. At a distance of 20-30 m from the flooded field, a horizontal filtration of the water is replaced

Card 1/2

USSR / Soil Science. Cultivation. Melioration, Erosion. J

Abs Jour: Ref Zhur-Biol., No 21, 1958, 95781.

Abstract: by an upward flow, which is accompanied by intensive evaporation and salinity of the soils of this strip. The content of salts in the first layer of soil here reaches 258 t/ha with a width of the strip of about 30 m. Chlorides predominate over sulfates. Within this strip, salinity is sharply reduced. After freeing the rice field from water, a flow-off of salts is observed from the zone of maximal salinity to the field. An upward flow of salts to the surface of the field occurs, and it is somewhat saline. However, the salinity of the area formerly under water does not reach the volume of salinity of its periphery. In the absence of a natural outlet for the rice fields, it is recommended to build a drainage network around it for the detention and shedding of filtered saline ground waters. -- S. A. Nikitin.

SOV-26-58-10-21/51

AUTHOR: Vladychenskiy, S.A., Doctor of Agricultural Sciences

TITLE: The Effect of Reservoirs on Soils (Vliyaniye vodokhranilishch na pochvy)

PERIODICAL: Priroda, 1958, Nr 10, pp 93-96 (USSR)

ABSTRACT: The Kafedra fiziki i melioratsii pochv (The Department of Soil Physics and Melioration) of the Moscow State University imeni M.V. Lomonosov has been carrying out research on the effect that reservoirs and storage lakes exert on the surrounding soils. The direct effect zone, caused by infiltration of the soil, has a radius of 300 - 400 m from the shore of the reservoir; in the zone of indirect effect, extending up to the natural watershed, the humidity of the soil is increased since the reservoir blocks the ground moisture flow, raising its level and slowing down its rate of flow. Three progressive soil belts are formed round the reservoir: 1) by swamping, 2) formation of water meadows, 3) by gleying. Swamping occurs in the direct effect zone by underground flooding and here agriculture is impossible. Its extent can be limited by digging drainage canals at strategic points around the reservoir. The adjacent water meadow zone

Card 1/2

-The Effect of Reservoirs on Soils

SOV-26-58-10-21/51

is suitable for hydrophytic agricultural plants which also help to dry out the soil. With proper care the gleaming zone presents no hindrance to agriculture and quite high yields can be obtained from it.

There are 2 photos and 1 schematic diagram.

Handbook on lacquer coating in the machine industry (Spravochnik po lakokrasochnym pokrytiyam v mashinostroyenii) Moscow, Izd-vo "Mashinostroyeniye", 1964.
475 p. illus., biblio. Errata slip inserted. 9500 copies printed.

TOPIC TAGS: lacquer, corrosion inhibitor, rust inhibitor, specialized coating,
working condition, safety engineering, fire protection

PURPOSE AND COVERAGE: The book is a handbook which contains information on
lacquer and test of lacquers. It also describes the technical characteristics
and designs of plants engaging in basic lacquering and drying processes. The
book is designated for engineering and technical workers of lacquering shops
in machine building industry and for planning organizations.

E. N. Vladychina. *Byull. Malyarnol Tekh.* 1938, No. 4-5,

13-6; *Khim. Referat. Zhur.* 2, No. 5, 111 (1939). --At 200° the time of drying of enamel paints, lacquers and primers in the induction drier is reduced by approx. 20-30% as compared with drying in a thermostat. Drying at above 200° effects a great saving in time. An increase of the temp. to 280° reduces the time of drying of the surface to 3-5 min. Films dried at 200° have an even, smooth surface without warping and bubbles and with a normal gloss. Above 200° there is a considerable decrease of gloss. The films dried in an induction drier are considerably harder than those dried in a thermostat. The resistance to water and to mineral oil is also increased. The induction drier is described. W. R. Henn

TITLE: Measurement of the specific volume resistivity of
paints used for spraying in an electrostatic field

PERIODICAL: Chemie a chemická technologie; Přehled technické
a hospodářské literatury, v.19, no. 3, 1962, 136,
abstract Ch 62-1860 (Lakokras. materialy, no. 5,
1961, 54 - 57)

TEXT: For evaluating paints used for spraying in an
electrostatic field it is essential to determine the specific
volume resistance. The author recommends some Soviet-produced
metering instruments (instrument MOM-4, etc.). The instruments
are fitted with polytetrafluoroethylene electrodes. The theory
on which the measurements are based is described and resistance
values are calculated. There are 2 photographs, 7 schematic
diagrams.

cation of only K, P or manure did not produce any effect on the start of the flower buds. Application of manure delayed blossoming by 7 days; application of NPK + manure - by 3 days; P + manure - by 1 day. Application of P and K did not show any effect on the dates of blossoming. An increase in the number of waterings from 1 to 3 per month produced an increase in the number of started flower buds by 1½ times and a delay of 10 days in blossoming. The summer pruning of the shoots produced a delay of 12 days in the beginning of blossoming. Trees pruned early
